## Construction Labour Management System Software

# Replace Manual Registers With GPS Attendance, Face Recognition, and Automated Wage Calculation

Ghost workers in manual registers, unverified overtime, and wage disputes from mismatched records cost construction companies money before a single bill is raised. Onsite captures verified attendance from site, links it to productivity data, and calculates wages automatically so every labour payment is accurate and auditable.

- ✓ Capture geo-tagged, face-verified attendance directly from site without manual registers
- ✓ Track labour productivity per activity, crew, and project in real time
- ✓ Calculate wages automatically from verified attendance data and contractor-wise rates

[Get Free Demo](#)[Check Pricing](#)

# Built for Construction Companies That Manage Large, Mobile Workforces Across Multiple Sites

Onsite construction labour management software serves every company type that tracks workers supplied by multiple contractors, measures productivity against site activities, and needs accurate wage calculations without manual reconciliation at month end.

**01**

## Contractors and Developers

Manual registers allow ghost workers and inflated headcounts to pass into payroll because no one cross-checks actual site presence. Onsite gives contractors GPS-verified, face-confirmed attendance

**02**

## Infra and EPC Companies

At scale, manual headcount verification across hundreds of workers and multiple contractors is practically impossible. Contractor-reported attendance overstates actual presence, and overpayment

**03**

## Interior and Fit-Out Firms

On tight-margin, short-cycle projects, a few unverified attendance days can erase project profitability entirely. Workers move between sites frequently, and manual registers cannot reliably track which worker was on which

**04**

## Infra & Industrial Project Teams

BOCW compliance and statutory contract labour records must be accurate and available on demand for government audits. Onsite maintains digital attendance records with timestamps, GPS proof, and contractor

across all sites so every wage payment rests on a record the site team generated at check-in, not on a register entry made after the fact.

accumulates before anyone reconciles it. Onsite gives EPC teams centralized attendance visibility per contractor, per zone, and per work package from one platform.

site on which day. Onsite verifies site presence at the moment of check-in and maintains worker payment records per project, so cost allocation stays clean.

linkage without a separate documentation exercise at inspection time.

### Industry Challenges

## From Site Check-In to Wage Payment — One Verified Labour Workflow

Onsite connects GPS and face-verified attendance capture, activity-linked productivity tracking, contractor-wise management, and automated wage calculation — so labour data flows from site to payroll without manual registers, contractor timesheets, or reconciliation delays.

## **Capture Verified Attendance With GPS and Face Recognition**

Workers check in from the Onsite mobile app with GPS location capture and face recognition confirming they are physically at the correct site. Every check-in carries a timestamp, GPS coordinates, and a biometric identity record that cannot be faked or backdated. Management sees live daily headcounts per site, per contractor, and per trade as attendance is recorded.

## **Track Labour Productivity Against Site Activities**

Onsite links each worker's attendance to the activity they are deployed on, so supervisors record output alongside presence. Managers see not just how many workers were on site but what those workers accomplished against the planned productivity rate for each activity. Activities consuming more labour days than budgeted are visible during execution, not after the project closes.

## **Manage Multiple Labour Contractors From One System**

Onsite maintains a separate attendance and payment ledger for each labour contractor, so contractor bills can be validated against system-recorded attendance rather than contractor-submitted timesheets. Discrepancies between claimed and recorded attendance are visible before any payment is approved. Contractor performance builds as a trackable record across billing cycles and projects.

## **Calculate Wages Automatically From Verified Attendance**

Onsite applies configured daily rates, overtime rules, and advance deductions to each worker's verified attendance record and generates wages automatically. No manual calculation, no separate reconciliation, no disputes from records the worker and contractor cannot agree on. Payment summaries are generated per worker, per contractor, and per project with a full calculation trail.

# Why Construction Labour Costs Exceed Budget Without a Verified Tracking System?

Labour cost overruns in construction are not always caused by wage rate increases or workforce shortages. Most of the leakage comes from attendance that was never verified, productivity that was never measured, and contractor bills that were approved against timesheets nobody cross-checked.

## Ghost Worker & Inflated Attendance Records

Manual registers are maintained by supervisors recording worker presence from memory or from the contractor's verbal report. Workers who

## No Visibility Into Labour Productivity

Attendance data tells you how many workers were on site. It says nothing about what they produced. Without linking attendance to activity and output, labour

## Bills Approved Without Independent Verification

Labour contractors submit timesheets and request payment. Without an independent attendance record, the only counter-evidence

## Wage Disputes From Manual Errors

Calculating wages for 150 workers across four contractors with different rates, advance balances, and overtime rules manually in Excel will produce errors. The question is not

left early, never arrived, or exist only on paper all appear as present. On busy sites, contractor-supplied labour bills routinely overstate actual attendance by 10 to 20 percent, and the company has no independent record to dispute it.

cost per unit cannot be calculated, the final project account shows a total labour cost with no breakdown, and the next project's budget gets built from the same guesses.

is the site register that the contractor typically influenced. Payments get approved because refusing them without documented evidence creates supply problems on an active site. The pattern repeats every billing cycle.

whether errors exist but whether they favour the company or the contractor. Resolving disputes requires tracing back through registers, advance records, and rate sheets that rarely agree with each other.

## Excel and Manual Registers Cannot Verify Construction Labour Attendance

A register records what a supervisor writes. A spreadsheet calculates what someone enters. Neither confirms that a worker was physically present on site, which is the only fact that makes a labour payment defensible.

- ✓ A manual register has no way to confirm a worker actually arrived. The same person whose claim is being disputed is the one who filled it.
- ✓ An Excel attendance sheet is data entry, not verification. There is no GPS stamp, no face match, and no way to detect a worker claimed on two contractor bills at once
- ✓ Attendance without activity linkage is just headcount. Knowing 30 masons were present on Tuesday says nothing about what they built or what it cost per unit.
- ✓ Manual wage calculation across 150 workers, four contractors, and multiple advance balances will contain errors. The only question is whether they favour the company or the contractor.

## Why Construction Companies Choose Onsite Labour Management Software

Replace manual registers and spreadsheets with one smart ERP software. Geo-tagged check-ins ensure accurate, verified records. Use Onsite & Digitize Construction Labour Management.

# GPS and Face-Verified Attendance Tracking

Onsite captures attendance through GPS location and face recognition at check-in, confirming physical presence at the correct site before recording any entry. Every check-in carries a timestamp, GPS coordinates, and biometric identity confirmation that cannot be altered retroactively. Management sees live attendance per site, contractor, and trade category throughout the day.

- ✓ Capture attendance with GPS location proof and face recognition at check-in
- ✓ View real-time headcounts per site, contractor, and trade category throughout the day
- ✓ Maintain a tamper-resistant attendance record for every worker on every site

# Activity-Based Labour Productivity Tracking

Onsite links each worker’s attendance to the site activity they are deployed on and records the output completed alongside the manpower present. This converts headcount data into productivity metrics: output per worker-day per activity, identifying where labour is running above budgeted rates during execution. Overruns are visible while corrective action is still possible.

- ✔ Assign workers to activities and record output against planned productivity rates
- ✔ Calculate cost per unit of output per activity from verified attendance and work records
- ✔ Identify activities over-consuming labour days while correction is still possible

# Contractor-Wise Labour Management and Bill Validation

<https://onsiteteams.com/products/construction-labour-management-software/>

9/22

Onsite maintains a separate attendance and payment ledger per labour contractor, so bills are validated against system-recorded data rather than contractor-submitted timesheets. Discrepancies between claimed and recorded attendance are flagged before payment approval. Contractor performance on attendance accuracy and billing consistency builds as a trackable record over time.

- ✓ Maintain contractor-wise worker rosters, attendance records, and payment ledgers
- ✓ Validate contractor bills against system-recorded attendance before approving payment
- ✓ Build contractor performance records across billing cycles for informed decisions

## How Onsite Simplifies Labour Management for Construction Site Teams?

Labour management failures in construction happen at predictable points — when attendance is recorded without verification, when productivity is never measured, and when wage calculations happen manually from records nobody cross-checked. Onsite addresses each of these gaps in sequence.

## 01

### **Workers Register and Check In With Verified Digital Attendance**

Workers are registered in Onsite with their personal details, contractor linkage, trade category, and face enrollment. Every subsequent check-in requires a face match and GPS confirmation from the site location before attendance is recorded. The entry cannot be backdated, performed remotely, or done by another person.

## 02

### **Supervisors Link Attendance to Activities and Record Daily Output**

As workers check in, supervisors assign them to the day's activities and record the work completed alongside the manpower present. This converts the attendance record from a headcount into a productivity record: output per worker per activity against the planned rate.

## 03

### **Contractor Bills Are Validated Against System Attendance Before Payment**

When labour contractors submit bills, the claimed worker-days are compared in Onsite against independently recorded check-in data for that period. Days where a contractor claims presence but Onsite has no verified check-in are flagged before the bill reaches

## 04

### **Wages Are Calculated Automatically and Payment Summaries Are Generated**

Onsite applies configured rates, overtime rules, and advance deductions to each worker's verified record and generates wages automatically. Payment summaries per worker, contractor, and project are produced with a full calculation trail. Disputes are

payment approval. Contractors are paid for verified attendance only.

resolved against the same attendance record the wage calculation used.

## What Construction Companies Say About Onsite Construction Labour Management Software?

### CUSTOMER SUCCESS STORY

We were running attendance on paper registers across three sites. Our labour contractor would submit a headcount at month end and we had no way to verify it against what actually happened on site. We were paying for workers who may not have shown up. **Onsite's GPS-based**

## attendance with face recognition stopped proxy entries completely.

We now see daily attendance per site in real time, wages calculate automatically from verified records, and our monthly labour billing disputes have dropped to zero.

# Zero

Labour billing disputes since switching to verified GPS attendance

### × BEFORE ONSITE

Paper registers across 3 sites · Contractor headcount unverifiable · Paying for ghost workers · Monthly billing disputes

### ✓ AFTER ONSITE

GPS + face recognition attendance · Real-time daily headcount per site · Auto wage calculation from verified records · Zero billing disputes

**Mr. Harish Menon, Managing Director**

# Additional Features That Strengthen Construction Labour Management

Onsite provides supplementary workforce tracking, compliance, and reporting capabilities that give construction companies complete labour visibility from daily attendance through statutory record maintenance and project-level cost analysis.

## Advance and Deduction Management

Record and track cash advances paid to workers and contractors, with deduction schedules applied automatically to subsequent wage calculations. Advance balances per

## Trade-Wise Headcount Reporting

View daily headcounts broken down by worker trade: mason, carpenter, electrician, plumber, helper. Trade-wise data helps project managers verify that the

## BOCW and Statutory Compliance Records

Maintain digital records of worker registration, contractor details, and attendance data in formats required for BOCW compliance and statutory reporting. Records are

worker are visible at payment time, preventing duplicate payments and ensuring net wages reflect actual entitlements.

right skill mix is on site for the day's planned activities before execution begins.

accessible on demand for government audits without manual compilation from scattered registers.

### **Labour Cost Per Project Reporting**

Generate project-level labour cost reports showing total worker-days consumed, wages paid per trade category, and contractor-wise payment summaries. These reports support project P&L analysis and give estimators verified productivity benchmarks for future labour budgeting.

### **Multi-Site Labour Dashboard**

View attendance, headcounts, and labour cost data across all active sites from one consolidated dashboard. Management identifies attendance anomalies, productivity shortfalls, or contractor billing discrepancies without requesting individual site reports.

### **Overtime and Shift Management**

Configure overtime rules and shift schedules per project or contractor, with Onsite applying correct rate multipliers automatically from check-in and check-out records. Overtime calculations are traceable to the specific entries that triggered them.

# 4 Tips to Improve Labour Management on Construction Sites

A digital attendance system produces accurate data only when the check-in process is enforced consistently and management acts on what the productivity data reveals. These practices determine whether the system changes labour cost outcomes on your projects.

## Enforce Check-In Before Work Begins, Not at the End of the Day

Batch attendance entry at day end defeats the entire purpose of GPS verification. It reintroduces the same manual recording step the system was adopted to eliminate. Train supervisors to treat the morning check-in as a non-negotiable site entry requirement. A worker without a confirmed Onsite check-in before work starts should not be assigned to site activities until the record is confirmed.

## Compare Contractor-Claimed Attendance Against Records Weekly

Weekly reconciliation takes one hour and involves seven days of data while anomalies are still fresh. The same reconciliation at month-end bill time involves 30 days of data, explained anomalies, and a contractor ready with supporting paperwork. Make the weekly attendance review a fixed process assigned to a specific person.

### **Link Every Worker to an Activity, Not Just to a Site**

Attendance at site level is headcount. Attendance linked to a specific activity: rebar on Floor 3, plastering in Block B, tells management what those workers produced and what it cost per unit. The extra step takes a supervisor two minutes at shift start and is the only basis for building accurate future labour estimates.

### **Review Labor Productivity Reports Before Monthly Payroll Processed**

Reviewing productivity data before payroll approval forces investigation while the data is actionable. A plastering crew that consumed 40 percent more labour days than budgeted is a question that should be answered before wages are paid, not after. This review occasionally identifies attendance entries that need correction before wages are calculated.

## Stop Paying for Labour That Was Never Verified on Site. Start Tracking With Onsite.

Every construction company using manual attendance registers is paying for some workers who were not there. The figure varies by site and contractor, but it is never zero. Onsite gives every worker a GPS-verified, face-confirmed check-in that creates an independent attendance record before any wage is calculated or contractor bill is approved. Check pricing or book a free demo today.

# FAQs

## **What is Onsite construction labour management software?**

Onsite construction labour management software is a digital workforce tracking platform built for contractors, developers, and EPC firms to capture GPS and face-verified attendance, track labour productivity against site activities, manage multiple labour contractors, and calculate wages automatically from verified records. It replaces manual attendance registers and contractor-submitted timesheets with an independent digital attendance record that management can reference when validating contractor bills and approving wage payments across all active projects and sites.

## **How does GPS-based attendance prevent ghost workers on construction sites?**

GPS-based attendance in Onsite requires each worker to check in from the physical site location before attendance is recorded. The system captures GPS coordinates at the moment of check-in, confirming that the worker is within the site boundary rather than checking in remotely or through a supervisor entering batch data later. Face recognition adds biometric identity confirmation so proxy attendance one worker checking in on behalf of another is detected and blocked. The combination of location verification and identity confirmation creates an attendance record that reflects physical site presence rather than a register entry.

## **How does face recognition work in Onsite labour attendance?**

Workers are enrolled in Onsite with a face scan during registration. Every subsequent check-in requires a face match against the enrolled record before attendance is confirmed. The system compares the real-time image captured at check-in against the stored enrollment photo and confirms identity before marking the worker present. This biometric step prevents proxy attendance where a worker checks in for an absent colleague. Face recognition works alongside GPS verification — both location and identity must be confirmed for an attendance entry to be accepted as valid.

## **Can Onsite track labour productivity by activity and not just headcount?**

Yes. Onsite links each worker's attendance to the site activity they are assigned to for that shift concrete pouring, masonry, plastering, MEP work, or any activity configured for the project. Supervisors record the output completed for each activity alongside the manpower deployed, allowing the system to calculate productivity metrics like output per worker-day for each task. Project managers

compare actual productivity rates against planned benchmarks, identify activities running below expected output, and make resource allocation decisions based on verified performance data rather than supervisor estimates.

### **How does Onsite validate labour contractor bills before payment?**

When a labour contractor submits a bill claiming a certain number of worker-days for the billing period, Onsite compares the claimed attendance against the system's independently recorded check-in data for each worker during that period. Days where the contractor claims a worker as present but Onsite has no verified GPS check-in for that worker are flagged as discrepancies before the bill reaches payment approval. Contractors receive payment only for attendance that the system independently confirmed. This validation step removes the need to accept contractor timesheets on trust and gives management an objective basis for approving or disputing any line on the bill.

### **Can Onsite manage multiple labour contractors across different projects?**

Yes. Onsite maintains a separate profile for each labour contractor — worker roster, trade-wise rates, daily deployment records, advance payment history, and billing ledger — all linked to the specific projects and sites where that contractor supplies workers. Management views contractor-wise attendance, productivity, and payment data across all active projects from one dashboard. Contractor performance builds up as a trackable record over time, giving management objective data on supply reliability, attendance accuracy, and billing consistency that informs contractor retention and rate negotiation decisions on future projects.

### **How does Onsite calculate wages automatically from attendance data?**

Onsite calculates wages by applying the configured daily rate for each worker's trade category to their verified attendance record for the billing period accounting for full days, half days, overtime hours, and any deductions for advances already paid. The calculation runs automatically from the attendance data without manual input from a payroll team. Payment summaries are generated per worker, per contractor, and per project, showing gross wages, all deductions, and net amounts due. The calculation trail is visible for each worker, showing exactly which attendance entries and which rates produced the final figure.

### **Does Onsite support BOCW compliance and statutory labour record keeping?**

Yes. Onsite maintains digital records of worker registration, contractor details, daily attendance with timestamps and GPS proof, and payment history in formats that support BOCW compliance and contract labour statutory reporting requirements. These records are accessible on demand for government audits without requiring manual compilation from site registers — which are typically incomplete, inconsistently formatted, and difficult to produce quickly when an inspection occurs. Digital records maintained continuously through normal attendance operations are inherently more audit-ready than registers compiled retrospectively.

Onsite is a construction management software built to help construction companies run projects with clarity and control. As a complete construction ERP software, it connects site teams, project managers, procurement, and finance on one platform. By replacing scattered tools and manual tracking, Onsite construction software helps businesses save time, reduce cost leakages, and improve execution across every project. The result is a practical ERP software that supports real site operations, not just reports.
